

VOC emissions from P1 sources (P1 fugitive sources, P1 silo sources, and P1 manufacturing sources) shall be limited to 10 lb/hr and 240 lb/day, each calculated as a rolling twelve (12) month average. At the conclusion of each month during which P1 sources have operated, Permittee shall calculate VOC emissions using established emission estimation techniques, and determine the hours and days of operation for the month. Permittee shall record the monthly VOC emission calculation and operating record and use this information to calculate average VOC emissions as lb/hr and lb/day for the rolling 12-month period then ending with that month.
